June 2017 Newsletter

<http://ksarri.org/kar/>
kb0rwi@arri.net

Kent Stutzman - KB0RWI

Hello all! Just as I was about to put the final touches on the newsletter, one last item came in. I am glad to get content and have considered a few items over the past month. I carried over the design and am considering a brand new look. So I would like to ask for people to take scenic pictures of Kansas from where ever you are and send them to me. The high resolution of most smart phones will be sufficient if taken in letter format, sized to fit 8.5"x 11" much like my picture to the left.

Of note in this newsletter is the Kansas Amateur of the Year award. There was no winner last year. It was found that many addresses were wrong and e-mails bounced. We change e-mails so often and forget where we need to make updates. This trickles across every aspect of our lives, online and in the hobby. I urge you to contact Chuck at the appropriate address in this newsletter to nominate a deserving person.

I will continue to compile a list of people wishing to be notified of the posting of the KAR to the website. If you would like to be added to the list, contact me with a note stating your wish. Have a great field day!

Kent Stutzman, KB0RWI

ARRL Midwest Director
Roderick K. Blocksome KØDAS

The ARRL Midwest Division June 2017 Newsletter is now available on the Division's Web page.
Here's the direct link:

<http://www.arrlmidwest.org/newsletter/newsletter.pdf>

This link always takes you to the current month's newsletter. If this month's newsletter doesn't open, try refreshing the page or clearing your browser's cache, in case your browser is loading a copy of a previous newsletter. Previous newsletters are available at:

<http://www.arrlmidwest.org/> and click on the Newsletter Archives link.

Highlights this month are:

ARRL Affiliated Clubs in the Midwest Division
Hutchinson, Kansas Wild Fires
Missouri Digital Radio Work
Back from the Pacific Ocean
Midwest Division Special Event Stations
Midwest Division ARRL Hamfests & Conventions

Thanks and 73's,

ARRL Midwest Division Director:
Roderick K Blocksome, K0DAS

Kansas QSO Party Update

August 26-27, 2017

The 2017 KSQP will be the 9th year of the KSQP. As the KSQP has quickly risen to be one of the QSO parties that is sought after by those that have worked the 1x1 stations in previous years, this year will be no different. Bob Harder, WØBH, the event organizer is looking to bring in yet another six letter word bringing the total number of 1x1 calls to 51 for the event. When asked for comment, Bob e-mailed: "I'm in the midst of assigning 1x1 calls for the 2017 KSQP. Interest is high and it looks like we'll have another great group of ops. Could you put in a reminder of the KSQP in the newsletter, and have anyone interested in operating as a 1x1 call who hasn't done it before get in contact with me by email ASAP?" If you want to be on the receiving end of a pile-up, contact Bob at kansas150@hotmail.com

Total Solar Eclipse 2017 - HamSCI

Ham Radio Science Citizen Investigation

HamSCI is the group organizing efforts for the Solar Eclipse QSO Party, as well as other research geared toward amateur radio and the solar eclipse. You can find them at <http://www.hamsci.org>

Kansas Amateur of the Year

The Kansas-Nebraska Radio Club in North Central Kansas is asking for nominations for Amateur of the Year. The award was last given out 2 years ago to Justin Reed NV8Q of Minneapolis, Kansas for his contributions and work he has put into the K-Link Repeater system and work he has done with other repeaters, clubs and individuals around the state. The KAOY award is given out at the Kansas State ARRL Convention, which is being held August 20 in Salina. If you or your Club knows of someone who is involved, volunteers and puts their time in to help as well as promote amateur radio; let us know. We will put together a committee of the past recipients to vote the new Amateur of the Year. Please e-mail Chuck, NØMXI at cmoore67467@sbcglobal.net or send nominations via postal mail to the Kansas-Nebraska Radio Club, c/o Chuck Moore, 413 E 6th, Minneapolis, KS 67467.

ARRL KANSAS STATE CONVENTION

AUGUST 20, 2017

Webster Conference Center, Ohio St, N of I-70

Sponsored by the Central Kansas Amateur Radio Club

Credit Cards will be accepted for Admission to the Convention

A bit into the feature, is the launching of a REGULUS guided missile... the Navy's FIRST, and basically a cruise-missile, as it had a jet engine, vs. a rocket (JATO assist WAS used, but the main propulsion was the small jet). This is the missile my Uncle Bill worked on on the USS TOLEDO (a cruiser). The electronic bits they speak of, amounted to a miniature tube socket with a phenolic tube underneath it, with terminal pads... the idea was that you could build whole circuits, directly under a tube. Installation & Repair was much quicker* - somewhere, I still have ONE of the circuits shown in this film, given to me, BY Uncle Bill.

* Unless you're replacing ALL the resistors on the LOW B+ line of a Collins KWM-2, which USED them!

Interesting to me, is that we "came back" to cruise missiles with JETS, some 45 years AFTER the Regulus was discontinued.

* The STORY:

My friend Hunter - KØGFY - bought a KWM-2 off of Ebite and it worked (on receive) for a while, until it began letting the smoke out of it's underside. This particular radio was powered by a Heathkit PS-23; not an uncommon method, but the PS-23 is "strained" some, as it's not quite up to the task. That said, when you're building the PS-23, there's a tap you must select when picking the LOW B+ voltage you want, and the fellow who sold the KWM-2 to my buddy, connected it to the HIGH setting, versus the LOW setting, where it should have been. Add to that, the wiring [sic] OF the PS-23 was pretty poor. The result of this particular story of chaos, was that it burned EVERY resistor on that Low B+ line, and THESE particular resistors were all located on the INSIDE of the layers of components, affixed to the Vector turret-type tube sockets, used by Collins.

The actual socket assembly is a 7 or 9 pin conventional phenolic socket, with a shellac'd cardboard tube, mounted on the underside of the socket. These then had 4 or 6 (depending upon the variety) wiring "loops" sticking out, to which you could attach several component leads, enabling you to BUILD the circuit right AT the tube. Not only did it save space, but kept parasitic oscillations to a bare minimum - UNFORTUNATELY, it also meant that in true compliance to Murphy's Law, the component you needed to change, would be at the level, CLOSEST to the tube, and NOT on the outside, where you could get at it.

This meant several hours with an ohmmeter, tracing the Low B+ line (Collins schematics are a bit like CAR schematics, with lots of terribly long s-t-r-a-i-g-h-t lines that are hard to follow from page-to-page, as when you'd turn a page in the manual, you could very easily lose your place and end up following the WRONG line... using the Ohmmeter was easier by a mile. Eventually, I found ALL the affected (that's a polite way of saying BURNED) resistors, and
